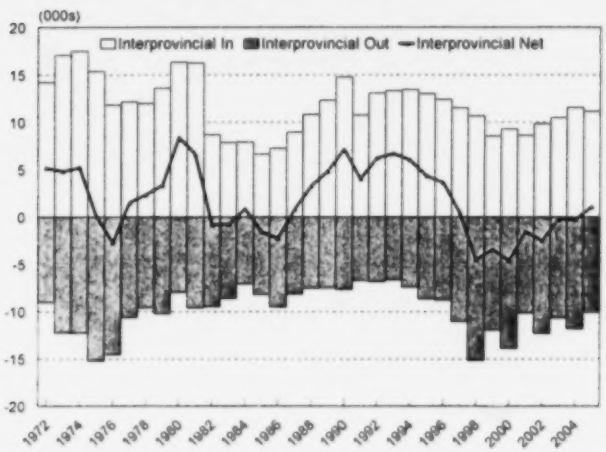
Migration Highlights ♦ First Quarter 2005

During the first quarter of 2005, BC gained a total of 10,836 persons as a result of net migration from **all sources**. This was substantially higher than the 7,407 and 7,029 migrants in the previous first quarters of 2004 and 2003 respectively. The increase in total net migration for the latest quarter was a result of an increase in both net interprovincial and international migration. When the number of births minus deaths are added to the migration figures, BC's population grew by 12,539 people between January 1, and March 31, 2005.

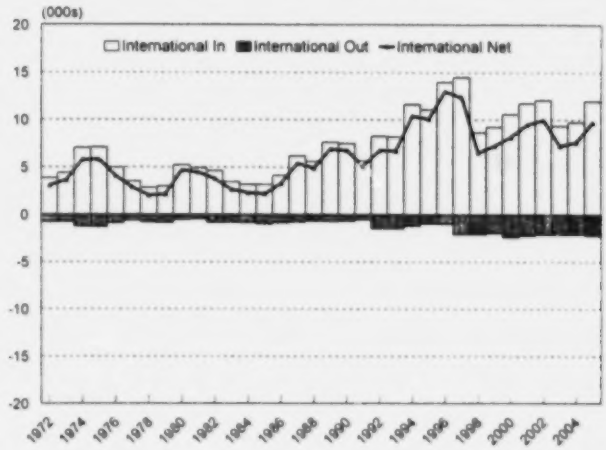
The first quarter net **interprovincial** migration was positive for the first time since 1997 with over one thousand more people moving into the province than out to other parts of Canada. Nonetheless, there was a net population loss to Alberta, which was more than made up by population gains from all other regions.

Interprovincial Migration - 1st Quarter



Net **international** migration for the province increased from approximately 7,700 people in the first quarter 2004 to over 9,700 people this quarter. This resulted primarily from an increase in immigration and the number of non-permanent residents. Over the last several decades, immigration has fluctuated from highs of above 14,000 to lows of under 3,000 people per quarter. Total emigration appears to fluctuate more moderately, however this component is the most difficult to accurately measure.

International Migration - 1st Quarter



Immigration to Canada rose from close to 55,000 in the first quarter last year to approximately 56,500 people this quarter, while BC's share of total Canadian immigration increased from a revised estimate of 16.3% to 18.5%. On an annual basis, British Columbia's population grew by 1.2%, slightly behind Alberta (1.5%) but faster than Ontario (1.1%).

Population Change
First Quarter 2005

Population: January 1, 2005	4,219,968
Plus Interprovincial Arrivals	11,139
Minus Interprovincial Departures	10,066
Plus Immigrants	10,442
Minus Total Net Emigrants	2,210
Plus Net Non-Permanent Residents	1,531
Plus Births	9,674
Minus Deaths	7,971
Population April 1, 2005	**4,232,507**

Feature Article—Migration between Core and Peripheral Areas

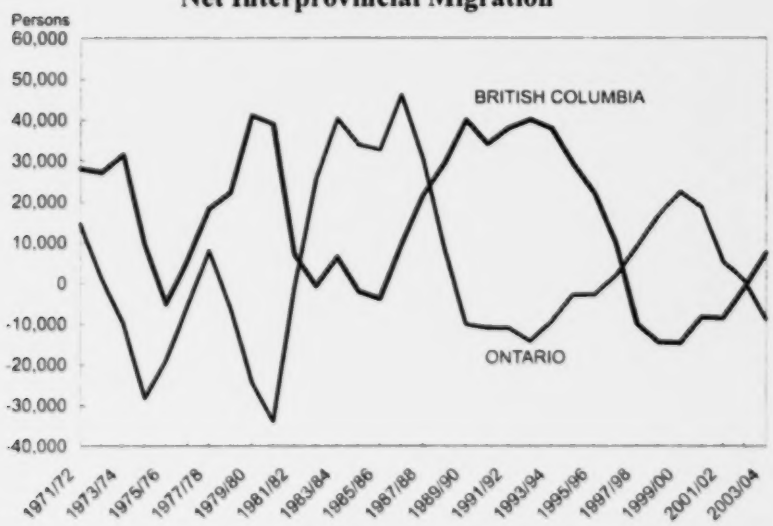
Springtime weather has allowed housing starts to climb rapidly again in BC; however, fewer units are being built in Ontario and Quebec. Rising commodity prices have resulted in more employment in the resource sector; however, for Central Canadians, manufacturers have been contending with higher input costs as well as increased competition from imported finished products. Over the last year, more people have been moving into BC from other provinces than out, once again resulting in positive net migration. At the same time, an increasing number of people are moving out of Ontario. Migration flows can help describe an important relationship between core and peripheral regions.

Over 12,000 more people moved in to BC than out, since the 2nd quarter of 2003

Within Canada, migration between provinces has fluctuated. As the graph shows, net migration for BC has oscillated with peaks followed by valleys, and reflects the 'boom and bust' nature of the economy. Net migration for Ontario has also fluctuated but in the opposite pattern. When net migration is most positive for BC, it is most negative for Ontario and vice versa. The one time period when the ebb and flow are not consistent between the provinces occurred in the mid 1970s, and is largely attributed to the general economic slow-down associated with the first OPEC oil shock.

Over 15,000 more people moved out of Ontario than in, since the 2nd quarter of 2003

Net Interprovincial Migration



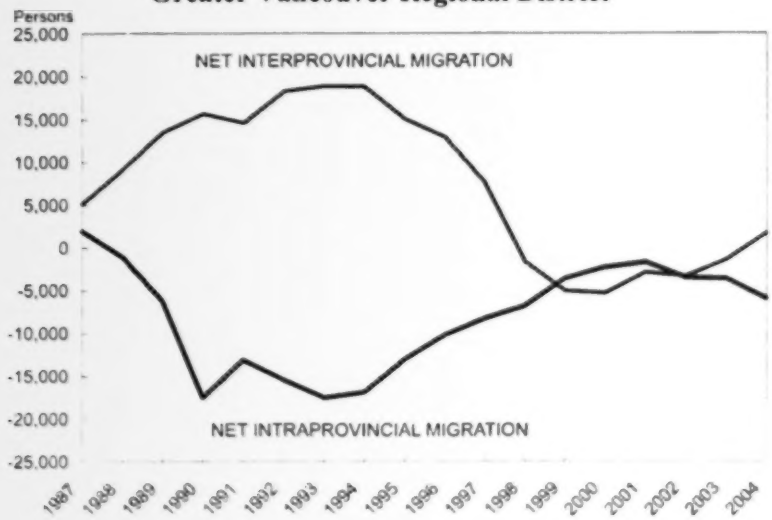
Source: Statistics Canada

The migration of people within the nation can be viewed in terms of the relationships between the extraction of raw resources and the movement of goods through processing facilities and then to retailers and eventually to customers. When there is an abundance of raw material, processors benefit from lower input costs resulting in more employment, outputs of refined products, and services. When the supply of raw resources declines, manufacturing tends to slow as commodity prices rise, although manufacturers of heavy equipment may do well.

Nationally, over 90,000 jobs have been lost in the manufacturing sector in the last 12 months. The majority of these were in Central Canada.

Most manufacturing, along with the attached administrative services, is found where most people live. In Canada, the most densely populated areas are found in the Windsor–Quebec City corridor. On the other hand, commodities are found in abundance where there are fewer people. As the supply of raw resources declines, its value rises, increasing employment opportunities in rural areas. In order to increase the supply of raw materials, wages rise, attracting migrants who are prepared to move out of higher to less densely populated areas. On the other hand, when there is an abundance of raw material available, commodity prices decline and manufacturing benefits from lower input costs.

Internal Migration to and from the Greater Vancouver Regional District [1]



When commodity prices are high, rural regions lose fewer people and gain migrants from core areas.

Source: Statistics Canada

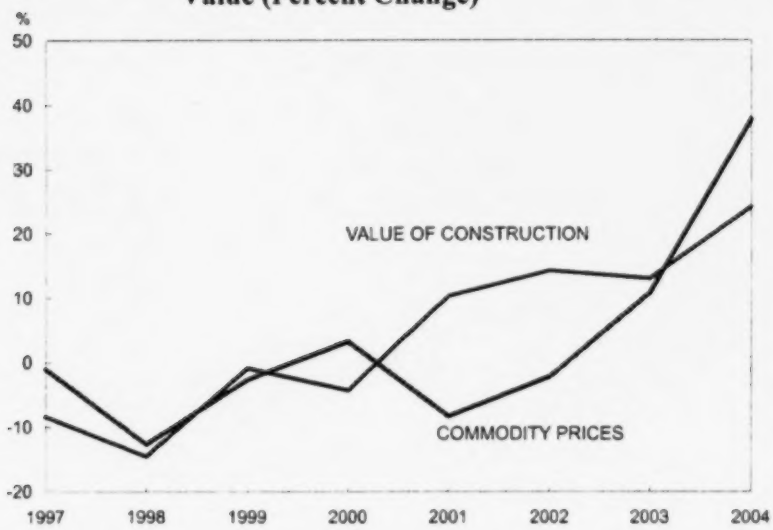
[1] Internal migration refers to migration within the nation. Intraprovincial migration refers to migration within a province, while interprovincial migration refers to migration between provinces

An increase in the extraction of raw resources results in increased transportation and warehousing as well as the attached administrative services. Not only do people move out of the nation's core to the resource-rich regions, but an increasing number of people move from the regional centres to the less densely populated rural areas.

One of the first migrants on the scene, whether during expansion into peripheral areas, or during contractions back to core areas, are builders. When the price of commodities increases, the building of extraction facilities, as well as transportation networks and housing, results in increased human (and consequently economic) activity in less densely populated areas. The reverse occurs when the price of commodities declines and employment opportunities in manufacturing increase. Currently, the most manufacturing-oriented regions in the country are experiencing weakening activity, while resource-based economies are growing.

During the last year, over half of the increase in construction employment nationally, occurred in BC.

Aggregated Commodity Prices and Total Building Permit Value (Percent Change)



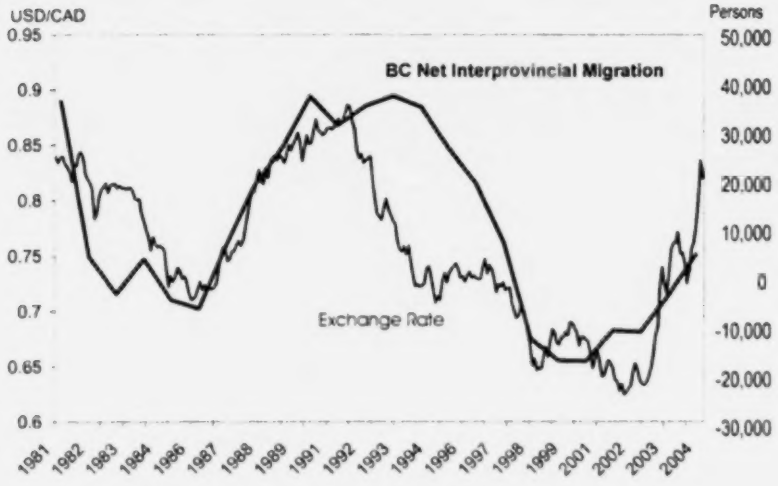
Source: Statistics Canada; BC Ministry of Energy, Mines and Petroleum Resources.

Commodities are in high demand and more people are moving into BC once again.

Since the value of the Canadian dollar relative to the US dollar largely reflects the change in the value of raw resources, it also correlates with net migration to and from resource-based economies. As the value of the Canadian dollar relative to the US

dollar and commodities rise, migration to resource based economies also tends to rise.

Exchange Rate and BC Net Interprovincial Migration



Source: Pacific Exchange Rate Service; Statistics Canada

Urbanization in China has helped increase interprovincial migration to BC.

Given the cyclical nature of resource-based activity, it is likely that fluctuations will continue to occur in the future. Two important factors that influence migration are at work currently. The urbanization of China with its complimentary increase in mechanization, driven by an increased use of fossil fuels, is resulting in an increase in demand for raw resources, and at the same time increasing the supply of finished products. This will likely continue to put pressure on Canadian manufacturers, thereby increasing out-migration from the Windsor–Quebec City corridor. At the same time, resource-based economies, particularly those with fossil fuels, will likely have an increase in in-migration.

If the transition in China from an agrarian to an industrial economy continues, even at a moderate rate, the bust side of the cycle may be avoided, at least for a while. However, without the benefit of a capable manufacturing sector, negative net migration for British Columbia may occur again.

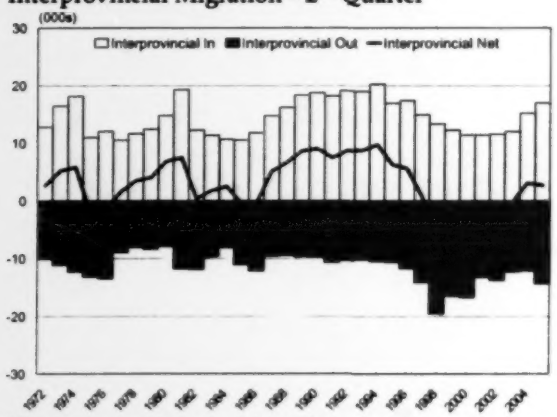
Migration Highlights ♦ Second Quarter 2005

During the second quarter of 2005, BC gained a total of 12,942 persons as a result of net migration from **all sources**. This was notably higher than the 10,762 and 9,209 migrants in the previous second quarters of 2004 and 2003, respectively. The increase in total net migration for the latest quarter was a result of an increase in international migration. Net interprovincial migration was marginally lower than the second quarter of 2004. When the number of births minus deaths are added to the migration figures, BC's population grew by 16,163 people between April 1, and July 1, 2005.

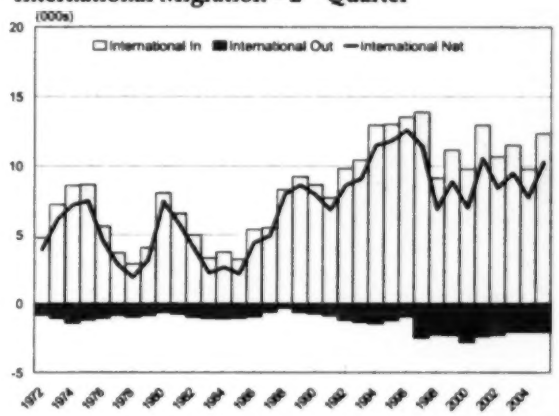
The second quarter net **interprovincial** migration was again positive, with nearly 2,700 more people moving into the province than out to other parts of Canada. BC had positive net migration from all provinces and territories in Canada. Even Alberta lost more people to BC than it gained (494) during the second quarter.

Interprovincial Migration - 2nd Quarter



Net **international** migration for the province increased from approximately 7,700 people in the second quarter 2004 to almost 10,300 people this quarter. This resulted primarily from an increase in immigration and the number of non-permanent residents. Since the second quarter 2004, the number of non-permanent residents (student visa holders, work permits, and refugee claimants) has risen from 78,542 to 83,401. The estimates of emigrants and returning Canadians has not been changed since 2003 which likely reflects the quality of the data as opposed to any real change.

International Migration - 2nd Quarter



Immigration to Canada rose from around 67,200 in the second quarter last year to approximately 74,500 people this quarter, while BC's share of total Canadian immigration increased from 15.1% to 16.1%. On an annual basis, British Columbia's population grew by 1.3%, faster than any province or territory, with the exception of Alberta's 1.6%.

Population Change
Second Quarter 2005

Population: April 1, 2005	4,238,359
Plus Interprovincial Arrivals	17,006
Minus Interprovincial Departures	14,341
Plus Immigrants	12,018
Minus Total Net Emigrants	2,043
Plus Net Non-Permanent Residents	302
Plus Births	10,405
Minus Deaths	7,184
Population July 1, 2005	**4,254,522**

Note: As part of the annual revision cycle, Statistics Canada has revised population data back to the 3rd quarter of 2002.

Overview

One of the more important demographic groups to take into consideration when looking at population change are females who are having children as their presence means that there is the potential for population increase. Where mothers choose to live can have a profound impact on population change. The migration of females during their reproductive years, as well as their fertility, highlights a major change in population growth in BC.

Not all females bear children, nor do they stay in one place. Therefore, in order to examine the impact of reproductive females it is helpful to consider the change in the number of births over time, as well as changes in fertility rates. It is also helpful to consider the migration of females, particularly those between the ages of 18 and 34, as well as the migration of young children, since families may be motivated to move after a child is born.

For BC, the total fertility rate has declined between 1987 and 2003 from 1,625 to 1,378 births per thousand women.

Births

The measure of the change in number of births does not give us a clear picture of an individuals' fertility behaviour, because it does not count people of childbearing age. The change in number of births may result from a change in the number of females of child bearing age (15-49) or a change in the propensity to bear children (fertility). A change in the number of females of child bearing age may be a result of the natural aging of the population and/or a result of migration. Nonetheless, an examination of a change in number of births by geographic area can highlight areas that are more or less attractive to families.

A look at the change in the number of births for all local health areas (LHAs) in BC shows that the vast majority of jurisdictions had fewer births in 2003 compared to 1986. This is a result of women having fewer children as well as changes in the number of females of child bearing years (15 to 49). Provincially, the average number of children each female has in her lifetime has been declining over the last few decades. For BC, the total fertility rate (TFR) has declined between 1987 and 2003 from 1,625 to 1,378 births

per thousand women. [1] Nonetheless, some LHAs showed an increase in births.

Almost all of the LHAs outside of the Lower Mainland had a decrease in births. The largest decline was for the Prince George LHA with 623 fewer births between 1986 and 2003. The only LHA with a primarily resource-based economy to show an increase was the Peace River North LHA in the north east. Prince George had a marginal increase in number of females of child bearing years (1.5%), while Peace River North had a 16% increase, primarily a result of positive net migration. It is likely that the increase in prosperity from oil and gas exploration and extraction over this time period had an influence on family formation.

In 2003, almost all of rural BC showed a decrease in number of births compared to 1986. The only exception was the Fort St. John area.

LHAs with the largest decrease in number of births between 1986 and 2003

LHA NAME	DIFFERENCE
Prince George	-629
Greater Victoria	-270
Peace River South	-269
Alberni	-242
Kamloops	-199
Trail	-191

Quesnel	-173
Vancouver Island North	-167
Cariboo-Chilcotin	-152
Richmond	-138
Kitimat	-129
Powell River	-125
Terrace	-122
Prince Rupert	-118

Victoria and Richmond share similarities with rural BC in terms of change in number of births.

Out of 83 LHAs, only 16 had an increase in the number of births and all but four (Central Okanagan, Summerland, North Peace River, and Saanich) were in the Lower Mainland. Even though the total fertility rate has been declining, the Lower Mainland has experienced an increase in the number of births. The number of females age 15 to 49

Peace River North	30
Langley	28
Summerland	12
Delta	9
Mission	7

In 2003, all but three LHAs in the Lower Mainland showed an increase in births compared to 1986.

A closer look at the Lower Mainland shows that Surrey had the greatest increase with 1,515 more births followed by Abbottsford, Burnaby, and Vancouver. Only three LHAs in the Lower Mainland had a decline in the number of births between 1986 and 2003: Richmond, North Vancouver, and West Vancouver. Of these, Richmond received the largest number of migrants, many of whom were new to Canada, but they were far less prone to reproduce than people moving to Surrey.

Both Richmond and Surrey are attractive to new Canadians but differ in terms of fertility.

An unusual area in the Lower Mainland is Langley where there was an increase of only 22 births between the years 1986 and 2003, much lower than its neighbours to the east and west. For families, the distance to Vancouver may be too great, but if economic activity continues to move east along the Fraser River, it is not unreasonable to assume that the number of families, and subsequently births, may rise in the future.

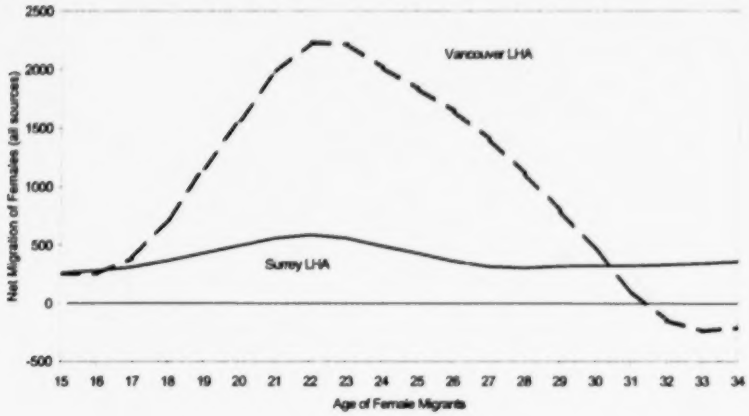
Net Migration

Core areas tend to be very attractive to people between 18 and 24 years of age. Migration out of the family home is most often in the direction of large urban centres for education, socialization, and employment, particularly

when there are few local job opportunities. For those youth already living in core areas, migration out of the home may be deferred. After a prolonged adolescence, they may move to start a family. While net migration to the core for females 18 to 24 was highly positive between 1996 and 2001, net migration was negative for females in their early thirties.

Vancouver's net migration becomes negative for females in their early thirties

Net migration of females, 15 to 34 between 1996 and 2001 for Surrey and Vancouver

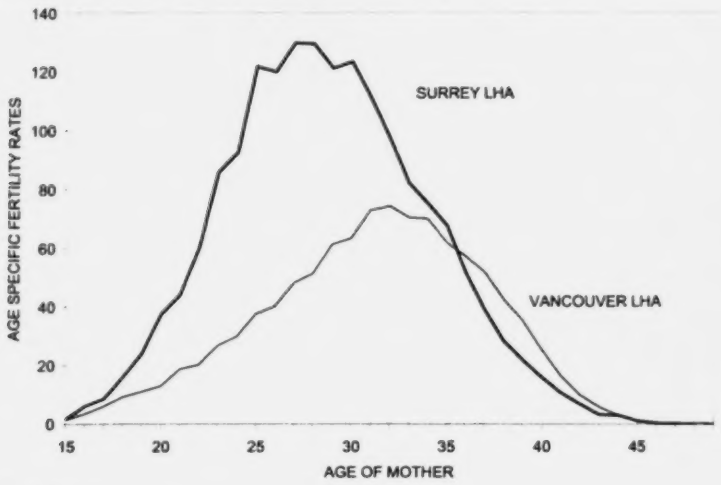


Migration out of the core to the surrounding bedroom communities allows people to maintain their social and economic ties while providing for family needs. Surrey is only one of the options available for people moving out of Vancouver. It offers an affordable alternative for families and consequently the fertility rates are higher here than in Vancouver. Surrey also is home to many new Canadians. Nonetheless, the total fertility rate for Surrey was lower in 2003 compared to 1986.

Age Specific Fertility Rates

The age specific fertility rates (averaged over the years 2001 to 2003) are much higher in Surrey than in Vancouver and tend to be highest for females in their mid to late twenties, while they are highest for females in their early thirties in Vancouver. For females in their early thirties in Vancouver, net migration becomes negative.

Age Specific Fertility Rates - Surrey and Vancouver (Average over 2001 to 2003)



Over 16,000 more children moved out of Vancouver than in since the early eighties.

Child Migrants

Not only does Surrey maintain positive net migration for females in their early thirties but it is also home to far more child migrants than Vancouver. Between 1996 and 2001, there were 4,300 more 'out' migrants than 'in' migrants between the ages of 0 and 6 years for Vancouver while there were close to 1,000 more children moving into Surrey than out.

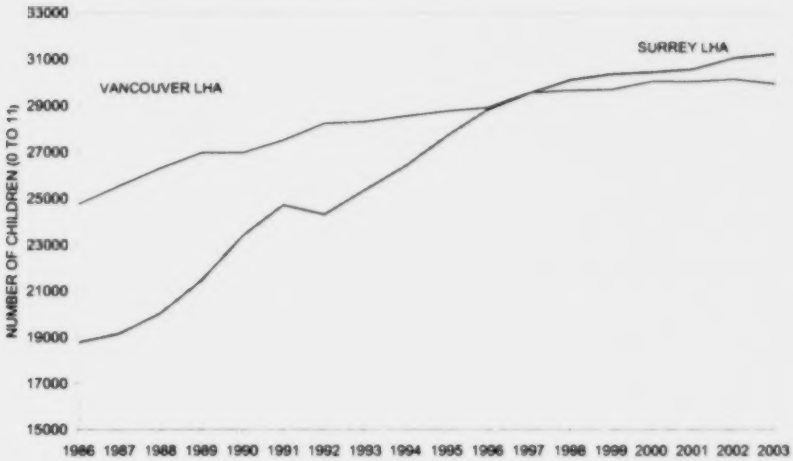
Close to 10,000 more children moved in to Surrey than out since the early eighties.

Number of net migrants 0 to 6 years of age

LHA NAME	1986	1991	1996	2001
Surrey	2,013	4,251	2,693	996
Vancouver	-3,335	-4,280	-4,250	-4,300

Combined with relatively high fertility rates, the strong in-migration has meant that the number of young children living in Surrey has grown rapidly over the last twenty years.

Population estimates of Children 0 to 11 Years of age in Surrey and Vancouver, 1986 to 2003



Summary

Between 1986 and 2003, efforts were made to encourage greater concentration of residents in the Lower Mainland in an attempt to reduce the environmental and economic costs of transportation. Higher density areas are being designed to attract and house people of all age groups, including families. Yet, while young adults may move to core areas for education, work, and socializing, they have been prone to move out when they are having and raising children. Child rearing usually occurs outside of the core areas in bedroom communities where accommodations provide greater access to the ground level, are more affordable and are family-oriented. Nonetheless, more children are being born in Vancouver as well, although not to the same extent.

The continuous positive net migration of females between the ages of 15 and 34, along with higher fertility rates, and the rapid increase in the number of children in Surrey, highlights an important change in population in the Lower Mainland. Over the next thirty years, migration patterns of females of reproductive age may change, and fertility rates may also vary; however, if current trends continue, Surrey may soon be home to the largest population in BC.

Prepared by: Population Section, BC STATS. Date: 28 September 2005

Source: Statistics Canada. Note: Net N.P.R. - Net change in the number of Non-Permanent Residents.

Due to revisions on the part of Statistics Canada, the sum of the components may not equal the population change.

All figures subject to revision.

Table 5

Quarterly Components of Change Per 1000 Population for Canada

		Migration										Natural Increase			Total	Population	
		Interprovincial			International					Total Net							
Year	Quarter	In	Out	Net	Immigration	Emigration	Net N.P.R.	Temp. Abroad	Returning Emigrants	Net	Migration	Births	Deaths	Natural Increase	Total Increase	Population at End of Period	Annual Growth Rate (%)

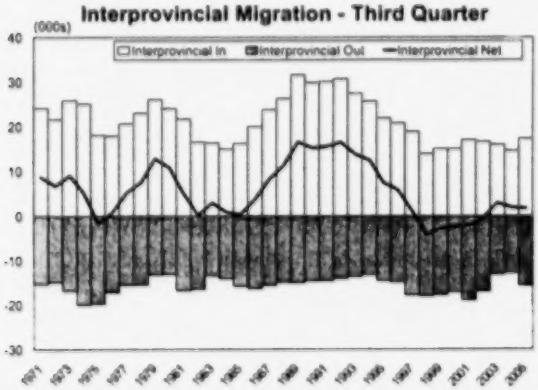
Migration Highlights ♦ Third Quarter 2005

During the third quarter of 2005, BC gained a total of 13,042 persons as a result of net migration from **all sources**. This was notably higher than the 10,625 and 9,660 migrants in the previous third quarters of 2004 and 2003, respectively. The increase in total net migration for the latest quarter was a result of an increase in international migration. Net interprovincial migration was marginally lower than the third quarter of 2004. When natural increase (births minus deaths) is added to the migration figures, BC's population grew by 16,688 people between July 1, and October 1, 2005.

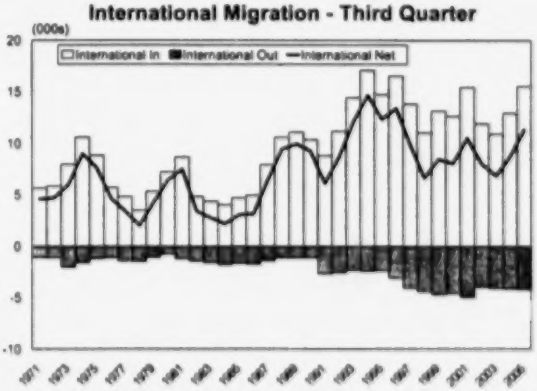
The third quarter net **interprovincial** migration was again positive, with 1,674 more people moving into the province than out to other parts of Canada. BC had positive net migration from all provinces and territories in Canada, with the exception of Alberta. In the third quarter, Alberta gained 1,340 more people than it lost to BC.

Interprovincial Migration - Third Quarter



Net **international** migration for the province increased from approximately 8,800 people in the third quarter 2004 to 11,368 people this quarter. This resulted primarily from an increase in immigration and the number of non-permanent residents. Since the third quarter 2004, the number of non-permanent residents (student visa holders, work permits, and refugee claimants) has risen from 81,106 to 86,466. The estimate of returning Canadians has remained constant since 2003 and the number of emigrants has not changed significantly. This likely reflects the quality of the data as opposed to any real change.

International Migration - Third Quarter



Immigration to Canada rose from around 65,500 in the third quarter last year to almost 76,000 people this quarter, while BC's share of total Canadian immigration increased from 15.8% to 16.4%. On an annual basis, British Columbia's population grew by 1.3%, following Alberta's 2% and the Northwest Territory's 1.4%.

Population Change
Third Quarter 2005

Population: July 1, 2005	4,254,522
Plus Interprovincial Arrivals	17,275
Minus Interprovincial Departures	15,601
Plus Immigrants	12,458
Minus Total Net Emigrants	4,155
Plus Net Non-Permanent Residents	3,065
Plus Births	10,735
Minus Deaths	7,089
Population October 1, 2005	**4,271,210**

Feature Article—Regional Migration

Migration, both between provinces and within the province, is a major factor driving population change within British Columbia. In addition to affecting the total population, the age of the migrants also influences the types of goods and services required to meet changes in demographics.

Interprovincial Migration

Unlike international migration, which most directly affects the lower mainland, interprovincial migration (between other provinces) and intraprovincial migration (between regions within BC) have a more widespread impact across the province.

Revised regional migration figures are now available for the period July 1, 2003 to 2004 (see Table 1). During this period, the province experienced positive net migration, for the first time in six years with an in-flow of approximately 7,865 people from other provinces. This resulted from an in-flow of ~50,400 people from other parts of the country, accompanied by a lower out-flow of ~42,550 people. Net interprovincial migration rebounded from 2002 to 2003, when approximately 1,000 more people moved out of the province than moved in.

After a prolonged economic decline, more people moved in to BC from other provinces than moved out between 2003 and 2004.

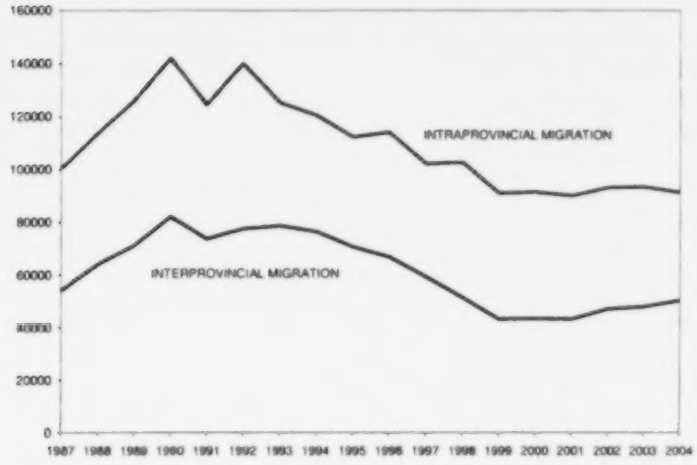
Across the province, 16 regions had positive net migration in-flows from other provinces between 2003 and 2004. Perhaps not surprisingly, the Greater Vancouver Regional District had the highest in-flow with 18,844 people estimated to have moved in, while 16,502 people moved out, for a population increase of 2,342 people. In the previous year, the GVRD had the most negative net interprovincial migration at -1,466. The Capital Region had the second highest positive net migration in 2003 to 2004, at 1,927, followed by the Nanaimo Regional District with approximately 1,300. Regional Districts in the interior and the Kootenays had the most negative net migration figures with Fraser-Fort George showing the greatest loss.

Intraprovincial Migration

The Fraser Valley Regional District gained the most people from intraprovincial migration.

Intraprovincial migration refers to the number of people moving from one area in the province to another within the province. Over the 2003 to 2004 time period, approximately 91,400 people migrated between Regional Districts within the province, a relatively low figure (see Table 2). There tends to be a relationship between interprovincial migration and intraprovincial migration. Periods when there are more people moving into BC from other parts of the country also have more people moving within the province. For example, in 1989/1990, 82,200 people migrated to BC from other provinces and another 142,000 people relocated to other regions within the province. Mobility tends to increase with an increase in economic activity. A regression analysis of interprovincial 'in' migration against intraprovincial 'in' migration shows an R^2 of over 90%.

BC Total Inter- and Intraprovincal In Migrants, 1987 to 2004

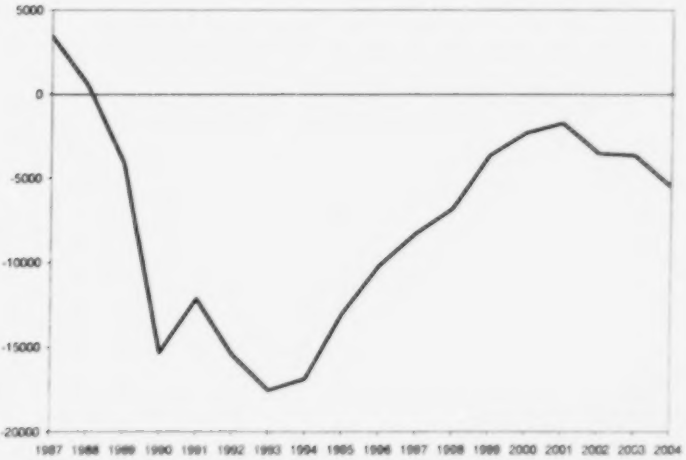


In the 2003 to 2004 time period, the Fraser Valley Regional District had the highest net in-flow of people from within the province, followed by the Nanaimo Regional District, with estimates of 1,928 and 1,568 respectively. The Greater Vancouver and Kitimat-Stikine Regional Districts had the highest net intraprovincial out-flows, with estimates of 5,501 and -515 respectively.

The Greater Vancouver and Kitimat-Stikine Regional Districts had the most negative net intraprovincial migrants in 2003 to 2004.

The high negative net intraprovincial migration for the Greater Vancouver Regional District has increased in recent years along with the increase in economic activity in the areas outside of the core.

GVRD Net Intraprovincal Migration, 1987 to 2004



With the rebound in regional economic activity expected for the next few years, net intraprovincial migration should become increasingly negative for the GVRD. At the peak of the last cycle, in 1993, approximately 17,500 more people moved out of the GVRD

than in from other parts of the province. However, losses of population from the GVRD to other parts of BC were more than offset by gains from international migration.

International Migration

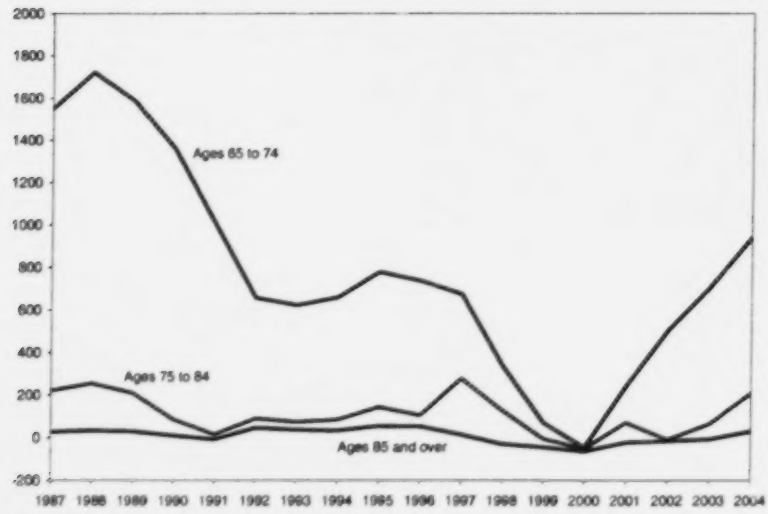
Over the last decade, approximately 90% of the people coming to the province from other countries moved to the Greater Vancouver Regional District. In 2003 to 2004, over 30,000 international migrants moved to the GVRD. Other regions of the province receive much lower international migration. In 2003 to 2004, the Fraser Valley had the second highest number of immigrants, at approximately 1,100 people, while the Capital Region received only 315 people from outside of Canada.

Over 90% of the international migrants moving to the province to the GVRD

Age of Migrants

Migrants are most often people in their late teens to mid-twenties, usually moving away from their childhood home, seeking education, employment, or both, as well as social activity. Thereafter, often those between 25 and 34 move again to start families of their own, for work and to improve their housing. Between 55 and 64, people may move again as children leave home, and, in some cases, living in close proximity to work is no longer required. After 65, people may move due to retirement, sometimes moving away from high-density areas to places outside of high commuter flow areas, or on the other hand, they may move to be closer to amenities. Studies indicate that the elderly are attracted to places of medium size and density.

Net Interprovincial Migration for the Elderly for BC, 1987 to 2004



BC is attractive to elderly migrants, particularly, during boom times

In the 2003 to 2004 time period, the 25 to 34 age group had the highest number of people moving between provinces (in plus out) , while the 15 to 24 age group had the highest number of intraprovincial migrants. As people age, they are less likely to migrate over longer distances. The proportion of interprovincial to intraprovincial migrants declines from over 40% for the 25 to 34 age group, to under 25% for those

over 85. In many cases the social and economic costs of moving to another part of the province are much lower than for moving between BC and another province, especially if the move is to a neighbouring region.

Nonetheless, BC is attractive to the elderly, particularly those 65 to 74, and especially when the economy is doing well. For the elderly, (those 65 and older) both the GVRD and the Capital Region were attractive for interprovincial migrants, but both also had more people move out than move in from other parts of the province.

As has been the case over the last two decades, the Fraser Valley, Central Okanagan, and Nanaimo Regional Districts have benefited from positive net migration. With the increased economic activity in the province, interprovincial numbers to these regions have increased as well. Perhaps, one of the reasons that the Central Okanagan has such a high positive net intraprovincial migration is that it attracts people of working age as well as those who no longer need to live in close proximity to work, for example, retirees. This region gained over 1,400 people in 2003/2004 from intraprovincial migration, and also gained approximately 1,275 people from other provinces. Intraprovincial migration for the 18 to 24 age group has remained positive even when the provincial economy declined in the late 1990s. This differs from the norm for regions as most experienced negative net intraprovincial migration for this age group.

The GVRD, Capital, Central Okanagan, Nanaimo, Peace River and the Northern Rockies were attractive to those 18 to 24 years of age in 2003/2004.

This tendency for negative net migration, whether intra- or interprovincial, for youths between 18 to 24, was not uncommon in 2003 to 2004, as only seven regions had positive figures. The Capital Region and the GVRD had more youths move in than out, perhaps due to educational opportunities as well as other economic and social reasons. As well as the Central Okanagan, the Nanaimo Regional District also had positive migration from within the province. The only other regions with positive flows for youths were the Peace River and Northern Rockies regions.

Table 1: Interprovincial Migration, July 1, 2003 to 2004

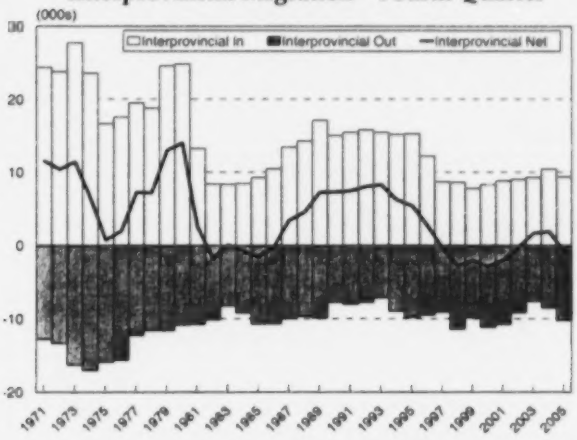
Migration Highlights ♦ Fourth Quarter 2005

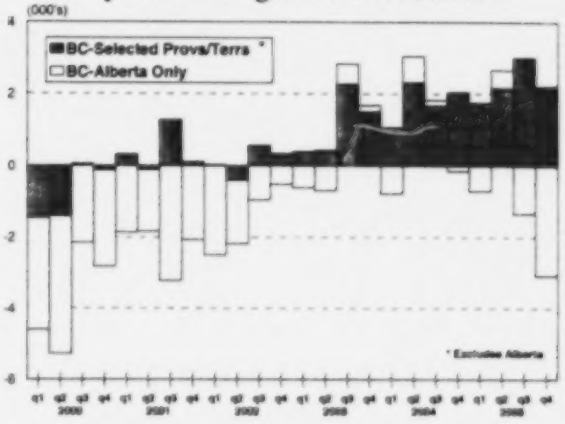
During the fourth quarter of 2005, Statistics Canada reported that B.C. gained a total of 6,033 persons as a result of net migration from **all sources**. This was lower than the 7,535 and 8,003 migrants in the previous fourth quarters of 2003 and 2004, but higher than the fourth quarter figures from 1997 to 2002. The positive total net migration for the latest quarter was a result of a positive net international migration of 6,902 plus a net interprovincial migration loss of -869. When natural increase (births minus deaths) is added to the migration figures, B.C.'s population grew by 8,252 people between October 1, 2005, and January 1, 2006.

Interprovincial Migration—Fourth Quarter



Fourth quarter net **interprovincial** migration was negative, with 869 more people moving out of the province than coming from other parts of Canada. However, with the exception of Alberta, B.C. had positive net migration from all provinces and territories in Canada. In the fourth quarter, Alberta gained 3,079 more people than it lost to B.C., while B.C. gained 2,210 more people from the rest of Canada (see fourth quarter Provincial Migflow map attached). Alberta was the only province or territory to have positive net interprovincial migration in the fourth quarter.

Interprovincial Migration—2004 and 2005



For all of 2005, net interprovincial migration to B.C. was 4,527 persons. However, on a province by province basis, B.C. lost 4,628 persons to Alberta, while gaining from all other regions (see attached Provincial Migflow 2005 map). Overall in 2005, only B.C., Alberta and Yukon had positive interprovincial migration.

Net international migration for the province increased from approximately 5,600 people in the fourth quarter 2004 to 6,900 this quarter. Compared to calendar year 2004, net international migration increased from 30,254 to 38,579 in 2005.

On an annual basis, British Columbia's population grew by 1.3%, which ranks second in Canada behind Alberta's 2.5%.

Population Change
Fourth Quarter 2005

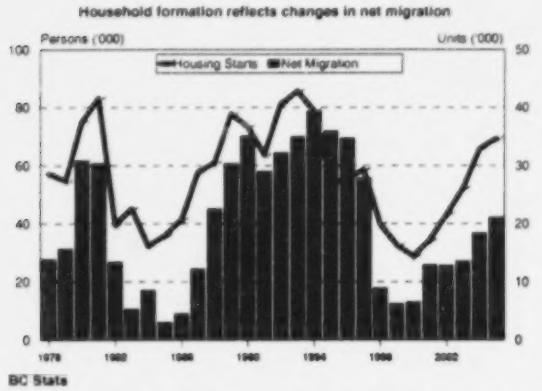
Feature Article: Migration and Housing Demand

Jennifer Hansen, Population Section, BC Stats

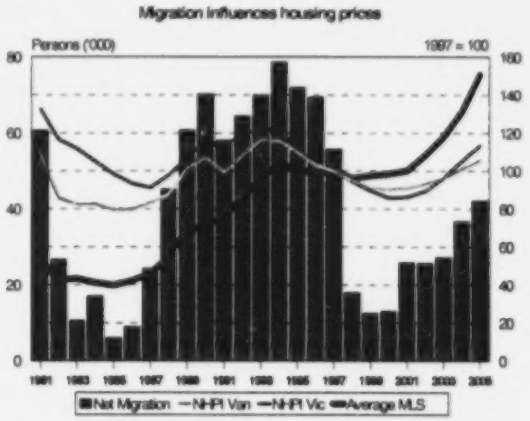
The demand for housing is influenced by a number of factors that are both demographic and economic in nature. On the demographic side, the changing age structure of the population and the composition of households will influence housing requirements. Also important are economic factors such as housing prices and interest rates. Migration to British Columbia from other parts of Canada and from other countries plays an important role in the demand for housing. The levels of net migration, as well as the characteristics of migrants, affect the number and type of dwellings needed.



There is a fairly strong relationship between net migration and changes in the housing stock, which represents the formation of new households in the province. As net migration weakened during the first half of the eighties, housing starts dropped sharply. The subsequent strong growth in net migration up to 1994 was accompanied by increases in housing starts in most years. As migration dropped from a net inflow of almost 80,000 persons in 1994 to roughly 13,000 in 1999 and 2000, housing starts also declined from a peak of 42,800 units in 1993 to 14,400 in 2000. Net migration levels have shown some recovery since the lows of 1999 and 2000, a trend which is expected to continue well into the future. Correspondingly, housing starts also show a surge from the lows of 2,000 to 34,600 units in 2005.

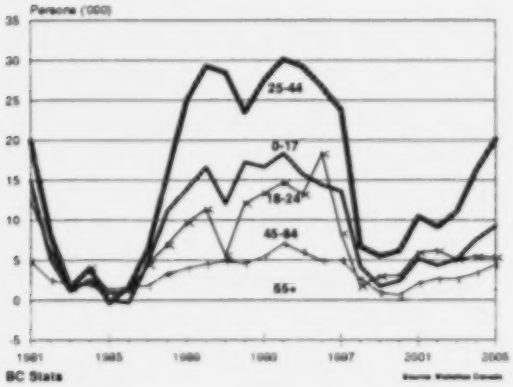
There are a variety of economic factors that affect housing demand. Mortgage rates and housing prices have an important influence on the affordability of housing. Interest rates for the average five-year conventional mortgage have been decreasing since 2000, when they reached a ten-year high of 8.2%. The average for a five-year mortgage in 2005 was only 5.5%. The relatively low cost of borrowing is a factor in the demand for housing.

When housing supply cannot keep pace with the demand for housing, the market compensates with price increases. On the other hand, an excess supply of housing may result in price decreases. The large changes in migration flows that have occurred over the last twenty years have played an important role in the fluctuation of housing prices.



From 1985 to 1994, the average MLS selling price of residential housing in BC rose fairly steadily. Thereafter, prices remained relatively flat until 2001 when both net migration levels and housing prices began to climb. From 2001 to 2005 the average residential housing price in B.C. increased by 50%. During the same time period, the Vancouver New Housing Price Index (NHPI) increased by 16% while the Victoria NHPI increased by 31%. The NHPI includes only new homes while the MLS figures include both new and pre-owned properties. The looser fit of MLS to net migration levels may indicate that migration is more closely linked to the price of new homes in large urban centres than to the overall price of housing in B.C.

Demographic factors which influence housing demand include the age structure of the population and the makeup of households and families. For example, increases in the number of separations and divorces could result in an increase in the formation of new households, while increases in the number of children per family could influence the type of housing required. Likewise, strong net inflows of people into the province result in a significant number of new households, thereby increasing the demand for housing.



The age characteristics of migrants can affect the type of housing demand generated by these migration flows. Most migrants tend to be young. In 1991, 1996 and 2001, 80 to 85% of migrants to B.C. were under the age of 45 years. However, difficult times have a powerful effect on migration of young people (and young families). The above chart demonstrates that the downturns in the B.C. economy in the mid 1980s and the late 1990s had the most significant effect on migration of those aged 25 to 44 years. Generally speaking, people in this age group are those engaged in household formation and either first-time home buying or "trading up" as they require more space with the arrival of children. Migrants in this age group are likely to look for single detached homes, particularly if they migrate with children. Net flows of seniors remained relatively stable from 1981 through 2005, and have consistently made up a relatively small proportion of overall migration to the province.

The size of households and the type of housing demanded varies considerably across different parts of the province. At the provincial level, the average number of people per household has declined only slightly from 2.6 in 1991 and 1996 to 2.5 in 2001. However, there has been considerably more movement at the regional level. The average size of households increased over the five year period between 1991 and 1996 in the Mainland/Southwest and Northeast regions. This increase from 2.6 to 2.7 persons per household in the Mainland/Southwest is likely related to the strong growth in immigration experienced during the period. However, between 1996 and 2001, all regions showed a drop in household size.

Development Region	1991	1996	2001
Vancouver Island/Coast	2.5	2.4	2.3
Mainland/Southwest	2.6	2.7	2.6
Thompson-Okanagan	2.5	2.5	2.4
Kootenay	2.5	2.5	2.4
Cariboo	2.9	2.8	2.6
North Coast	3.0	2.9	2.7
Nechako	3.0	2.9	2.7
Northeast	2.8	2.9	2.7
British Columbia	2.6	2.6	2.5

Source: Statistics Canada, 1991, 1996 and 2001 Census of Canada.

There have also been shifts in the distribution of types of housing between 1991 and 2001. At the provincial level, the share of single-detached housing fell from 58.6% in 1991 to 56.2% in 1996 and to 54.8% in 2001. On the other hand, the share of all forms of multiple dwellings increased with the relative increase being the strongest for detached duplexes and row houses. Some of the shift from single houses to duplexes may reflect the addition of a secondary suite within a former single-detached house.

Prepared by: Population Section, BC STATS. Date: 28 March 2006

Source: Statistics Canada

Note: Net N.P.R. - Net change in the number of Non-Permanent Residents.
Due to revisions on the part of Statistics Canada, the sum of the components may not equal the population change.
All figures subject to revision.
